Accuracy of negative dipstick urine analysis in ruling out urinary tract infection in adults

Report by Nick Ohly, Senior House Officer
Checked by Stewart Teece, Clinical Research Fellow

Abstract
A short cut review was carried out to establish whether negative dipstick urine analysis is sensitive enough to rule out urinary tract infection (UTI) in adults with urinary symptoms. Altogether 75 papers were found using the reported search, of which two presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of these best papers are tabulated. A clinical bottom line is stated.

Clinical scenario
A 20 year old student presents to the emergency department with a three day history of urinary frequency, dysuria, and lower abdominal pain. Examination is unremarkable and dipstick urine analysis is normal. You wonder whether normal dipstick urine analysis is sufficient to rule out a UTI or whether antibiotics anyway should be prescribed whatever the result.

Three part question
In [adults with symptoms of a urinary tract infection] does [negative dipstick urine analysis] rule out a [UTI]?

Search strategy
Medline 1966–04/03 using the OVID interface. [(exp Urinalysis OR exp Indicators and Reagents OR exp Reagent Strips OR stix.af OR urinanalysis.af) AND (exp Urinary Tract Infections OR (urin$ adj5 infect$).af OR UTI.af OR exp Bacteriuria OR bacteriur$.af) AND (dysuria.af OR frequency.af OR haematuria.af OR hematuria.af OR stranguria.af OR urgency.af)) LIMIT to human AND English language AND all adult <19 plus years>]

Search outcome
Altogether 75 papers were found. Of these, two were identified as answering the three part question. One of these was a meta-analysis containing nine papers not identified by the original search as they did not consider dipstick urine analysis (table 1).

Comment(s)
The meta-analysis shows that the prevalence of UTI in patients who present with symptoms of UTI is around 50%. The probability of UTI is even higher (around 90%) with a convincing history. Dipstick urine analysis is a quick and inexpensive test however sensitivity (and therefore negative
predictive value) were found to be as low as 75%. Some studies included in the meta-analysis were of low quality and further studies need to be done in this field.

**CLINICAL BOTTOM LINE**

Dipstick urine analysis is of insufficient sensitivity to be used to rule out UTI in patients with one or more symptoms.

**Venous blood gas in adult patients with diabetic ketoacidosis**

**Report by Ziauddin Hassan, Devasena M Subramonyam, Registrars**

**Checked by Shobhan Thakore, Specialist Registrar**

**Abstract**

A short cut review was carried out to establish whether venous blood measurement accurately demonstrates the degree of acidosis in patients with diabetic ketoacidosis. A total of 27 papers were found using the reported search, of which two presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of these best papers are tabulated. A clinical bottom line is stated.

**Clinical scenario**

A 22 year old insulin dependent diabetic presents to our emergency department with a raised blood sugar and urine dipstick showing +++ of ketones. You suspect diabetic ketoacidosis and would like the know the degree of his acidosis, but the patient refuses arterial blood gas sampling due to a previous bad experience. You wonder whether venous blood would accurately show the degree of his metabolic acidosis.

**Three part question**

In [an adult patient with diabetic ketoacidosis] do [venous blood gases] accurately demonstrate [the degree of acidosis]?

**Search strategy**

Medline 1966–04/03 using the OVID interface. [(venous blood.mp OR exp blood specimen collection OR exp blood gas analysis) AND (exp diabetic ketoacidosis OR diabetic ketoacidosis.mp OR exp diabetic coma) AND (exp acidosis OR acidosis.mp OR exp hydrogen-ion concentration)] AND LIMIT to human AND English language.

**Search outcome**

Altogether 27 papers were found of which only two are relevant and of sufficient quality for inclusion (table 2).

**Comment(s)**

There are only a limited number of studies on this subject and these have involved small numbers of patients. Further studies with large series of patients are necessary.

Antithrombotic treatment of below knee deep venous thrombosis

Report by Kerstin Hogg, Clinical Research Fellow

Checked by Andrew Ashton, Senior Clinical Fellow

Abstract

A short cut review was carried out to establish whether oral anticoagulation is necessary to prevent pulmonary embolisation in patients with below knee deep venous thrombosis. A total of 425 papers were found using the reported search, of which 11 presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of these best papers are tabulated. A clinical bottom line is stated.

Clinical scenario

A 50 year old man attends the emergency department with a plethoric, swollen left calf. Ultrasound examination reveals a posterior tibial vein thrombosis. You wonder what the risk of a pulmonary embolus is and whether he should be anticoagulated.

Three part question

In [a patient with a below knee venous thrombus], is [oral anticoagulation necessary] to prevent [a pulmonary embolus]?

Search strategy

Medline 1966–04/03 using the OVID interface. [{(DVT.mp OR exp venous thrombosis OR "deep vein thrombosis".mp) AND ("below knee".mp OR calf.mp OR popliteal.mp OR exp popliteal vein OR fibular.mp OR peroneal.mp OR posterior tibial.mp) OR "deep calf venous thrombosis".mp OR "calf vein thrombti.mp")AND (therapy.mp OR exp therapeutics OR treatment.mp OR exp heparin OR exp heparin, low-molecular-weight OR heparin.mp OR exp warfarin OR warfarin.mp OR exp coumarins OR coumarin.mp)] LIMIT to human and English.

Search outcome

Altogether 425 papers were found, only 10 original papers and one literature review addressed the question. Some studies included other patients with PE or thigh DVTs—only the patients with calf thrombosis are described (table 3).

Comment(s)

All of these studies could have been more thorough in their diagnostic criteria and/or follow up. However, despite the flaws it is clear that pulmonary emboli do result from below knee thrombi.

▶ CLINICAL BOTTOM LINE

All patients with calf thrombosis should receive oral anticoagulation.

Buccal nitrates in left ventricular failure

Report by Dhurga Gnasesgaram, Senior Clinical Fellow

Checked by Jon Argall, Senior Clinical Fellow

Abstract

A short cut review was carried out to establish whether buccal and intravenous nitrates are equally effective at preload reduction in patients with left ventricular failure. Seven papers were found using the reported search, of which one presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of this best paper is tabulated. A clinical bottom line is stated.

Clinical scenario

You are called to see a 60 year old man who has been increasingly breathless for a week. Examination reveals him to be mildly dyspnoeic at rest with a raised JVP and bibasal creps. There is evidence of ischaemia on his ECG. The chest radiograph shows upper lobe diversion and Kerley B lines. You wonder whether buccal suscard would be an appropriate alternative to a GTN infusion.

Three part question

In [a patient with left ventricular failure] are [buccal nitrates equivalent to a nitrate infusion] for [preload reduction]?

Search strategy

Medline 1966–04/03 using the OVID interface. [{(exp nitrates OR nitrate.mp OR exp nitroglycerin OR nitroglycerin.mp OR exp vasodilator agents OR GTN.mp OR glyceryl trinitrate.mp OR exp isosorbide dinitrate OR isoket.mp OR Sustard.mp) AND (buccal.mp OR exp mouth mucosa OR exp administration, buccal) AND (exp injections, intravenous OR intravenous.mp OR IV.mp)) AND (exp heart failure, congestive OR heart failure.mp OR LVF.mp OR exp left ventricular failure.mp OR exp congestive cardiac failure.mp OR exp ventricular dysfunction, left OR exp ventricular dysfunction OR exp pulmonary oedema)] LIMIT to human AND English language.

Search outcome

Altogether seven papers were found, of which five were reviews of nitrates rather than comparative studies. The two

</tbody>
</table>
remaining publications consisted of a summary report and full article relating to the same trial. The results of this trial are shown in table 4.

**Comment(s)**
There is very limited evidence available to allow direct comparison between intravenous and buccal routes.

**CLINICAL BOTTOM LINE**
Buccal nitrates produce an immediate reduction in preload (comparable with intravenous GTN).

**Oral methionine compared with intravenous n-acetyl cysteine for paracetamol overdose**

**Report by Walid Alsalim, Specialist Registrar**

**Checked by Mohamed Fadel, Specialist Registrar**

**Abstract**
A short cut review was carried out to establish whether methionine was better than n-acetyl cysteine at reducing the severity of liver damage after paracetamol overdose. Thirty nine papers were found using the reported search, of which two presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of these best papers are tabulated. A clinical bottom line is stated.

**Clinical scenario**
A 19 year old woman brought to the emergency department six hours after paracetamol overdose. She is fully conscious and admits ingestion of 32 tablets of paracetamol. She is complaining of abdominal discomfort but no nausea or vomiting. Her examination is unremarkable. You arranged blood investigations. Intravenous access and n-acetyl cysteine infusion started as per protocol. You wonder whether oral methionine would have been as effective as n-acetyl cysteine in her treatment.

**Three part question**
In a [patient with paracetamol overdose within eight hours] is [methionine as good as or better than n-acetyl cysteine] at [reducing liver damage]?

**Search strategy**

**Search outcome**
Altogether 39 papers were found, of which two were relevant (table 5).

**Comment(s)**
There have been no randomised controlled trials and only two prospective observational studies comparing these two drugs. However, patients in these two studies had the antidote within eight hours.

**Clinical probability scoring and pulmonary embolism**

**Report by Ged Brown, Specialist Registrar**  
**Checked by Kerstin Hogg, Clinical Research Fellow**

**Abstract**
A short cut review was carried out to establish the diagnostic utility of clinical probability scoring in stratifying the risk of pulmonary embolus. A total of 938 papers were found using the reported search, of which three presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of these best papers are tabulated. A clinical bottom line is stated.

**Clinical scenario**
A 30 year old man presents to the department with a spontaneous onset of atraumatic pleuritic chest pain. He has no previous medical history and has no shortness of breath or haemodynamic compromise. You wonder whether his clinical features and risk factors can help to safely exclude a pulmonary embolus.

**Three part question**
In a patient presenting with features suggestive of pulmonary embolus what is the diagnostic utility of clinical probability scoring in stratifying risk of pulmonary embolus?

**Search strategy**
Medline 1966–04/03 using the OVID interface. (exp Pulmonary Embolism OR esp Thromboembolism OR PE.mp OR pulmonary infarct$ OR pulmonary embolism.mp) AND (exp Risk Assessment OR risk assessment.mp OR risk stratification.mp OR probability.mp) LIMIT to human AND English language.

<td>The authors suggest that the decision rule would determine a low risk group suitable for application of a d-dimer test—this has yet to be validated.</td>
</tr>
</tbody>
</table>

**Search outcome**
Altogether 938 papers were found of which 935 papers were irrelevant to the question, of insufficient quality or did not report a mathematically derived scoring systems. The remaining three are included in table 6.

NB The clinical scoring systems have not been represented in the table. Please refer to the individual papers for these details.

**Comments**
There is evidence to suggest a variety of clinical models can be used to stratify patients into different levels of risk for PE. It is possible that these may be combined with other tests to give an acceptably low post-test probability of PE.

**CLINICAL BOTTOM LINE**
Clinical risk stratification is a potentially useful method of identifying low risk patients in whom PE may be safely excluded by simple non-invasive tests.

</table>

sufficiently sensitive to rule out pulmonary embolus. A total of 272 papers were found using the reported search, of which five presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of these best papers are tabulated. A clinical bottom line is stated.

Clinical scenario
A 34 year old woman presents with a two day history of pleuritic chest pain. There are no abnormal physical signs and her only risk factor is that she is taking oral contraceptives long term. You wonder if a combination of clinical examination and the available d-dimer test (SimpliRED) would be suitable to rule out pulmonary embolism.

Three part question
In [suspected PE] is [bedside clinical examination and simpliRED d-dimer] sufficiently sensitive at [ruling out PE]?

Search strategy

Search outcome
Altogether 272 papers were identified of which five were relevant and of sufficient quality. These are shown in table 7.

Comment(s)
Use of a bedside clinical decision rule for PE probability with the additional use of latex agglutination d-dimer testing results in high levels of sensitivity and high negative predictive values in the low PE risk groups. It is this group of patients that makes up the bulk of patients with a putative diagnosis of PE. However, latex agglutination d-dimers do not perform well in high or even moderate risk groups.

> CLINICAL BOTTOM LINE
Patients at low clinical risk with a negative bedside d-dimer can have pulmonary embolus ruled out.

IL D-dimer test in the diagnosis of pulmonary embolism

Report by Kerstin Hogg, Clinical Research Fellow

Checked by Russell Boyd, Consultant

Abstract
A short cut review was carried out to establish whether a negative IL D-dimer test alone could be used to rule out a diagnosis of pulmonary embolus. Six papers were found using the reported search, of which four presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of these best papers are tabulated. A clinical bottom line is stated.
Clinical scenario
A 30 year old woman presents to the emergency department with distressing, left sided pleuritic chest pain. She may have had a pulmonary embolism and you request an IL D-dimer test. You know the laboratory in your hospital uses the IL D-dimer test and wonder whether a normal result would be sufficiently sensitive to rule out a pulmonary embolus.

Three part question
In a [patient with suspected pulmonary embolus] does a [negative IL D-dimer test] adequately [rule out the diagnosis]? In a [patient with suspected pulmonary embolus] does a [negative IL D-dimer test] adequately [rule out the diagnosis]?

Search strategy
Medline 1966–04/03 using the OVD interface. [(D-dimer.mp or exp Fibrin Fibrinogen Degredation Products or FDP.mp) AND [IL test.mp] AND [exp Thromboembolism or exp Pulmonary Embolism or pulmonary embol$.mp or PE.mp or pulmonary infarct$.mp or exp venous thromboembolism$)].

Search outcome
Six papers were found from the above search. Four were relevant. One further paper was found from hand searching journals and references. These five papers are shown in table 8.

Comments
To date there have been few studies measuring the accuracy of this D-dimer test. Of note, there is almost no research looking in particular at patients presenting with symptoms of PE. The sensitivity of the IL test for ruling out DVT seems to lie somewhere between 90% and 100%. It is worth noting that all of these studies used a comparatively low cut off level and it is worth being aware what the cut off level is in your hospital laboratory.

<td>Prospective cohort</td>
<td>Sensitivity of SimpliRED, IL test and Accuclot Specificity of SimpliRED, IL test and Accuclot</td>
<td>80% 91% 91% 79% 74% 76%</td>
<td>Results combined for ?DVT and ?PE patients Cut off level of 200 ng/ml was used for IL test [much lower than most labs]</td>
</tr>
</tbody>
</table>

& CLINICAL BOTTOM LINE
The IL D-dimer test alone is not sufficiently sensitive to rule out pulmonary embolus. It must be used in conjunction with another test.

Outpatient investigation of pulmonary embolism

Report by Kerstin Hogg, Clinical Research Fellow

Checked by Debbie Dawson, Clinical Research Nurse

Abstract
A short cut review was carried out to establish whether outpatient investigation of suspected pulmonary embolus is a safe strategy. A total of 198 papers were found using the reported search, of which one presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of this best paper are tabulated. A clinical bottom line is stated.

Clinical scenario
A 38 year old man presents to the emergency department with left posterior pleuritic chest pain. He had a DVT eight years ago and his d-dimer levels are raised. He is haemodynamically stable with normal oxygen saturations, ECG, and chest radiograph. You would like to rule out a pulmonary embolism, but it is 8 pm. You wonder whether it would be safe to discharge the patient home overnight before his VQ scan tomorrow.

Three part question
In a [patient with suspected pulmonary embolism] is [outpatient investigation] [safe]?

Search strategy
Medline 1966–04/03 using the OVID interface. [(pulmonary embol$.mp OR exp Pulmonary Embolism OR PE.mp OR exp Thromboembolism OR pulmonary infarct$.mp) AND (diagnosis.mp OR exp Diagnosis) AND (outpatient.mp OR exp Outpatients OR clinic.mp OR exp Outpatient clinics, hospital)] LIMIT to human AND English.

Search outcome
Altogether 198 papers were found, one of which looked at outpatient investigation of patients with suspected PE. This is shown in table 9.

Comments
This is the only published study looking at outpatient investigation of PE and is small. Further research is needed.

> CLINICAL BOTTOM LINE
It may be safe to investigate selected patients with suspected pulmonary embolus at home.

Outpatient treatment of pulmonary embolism

Report by Kerstin Hogg, Clinical Research Fellow

Checked by Debbie Dawson, Clinical Research Nurse

Abstract
A short cut review was carried out to establish whether outpatient treatment of patients with pulmonary embolus is a safe strategy. Sixty six papers were found using the reported search, of which one presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of this best paper are tabulated. A clinical bottom line is stated.

Clinical scenario
A 38 year old man presents to the emergency department with left posterior pleuritic chest pain. He had a DVT eight years ago and his d-dimer levels are raised. He is haemodynamically stable with normal oxygen saturations, ECG, and chest radiograph. You would like to rule out a pulmonary embolism, but it is 8 pm. You wonder whether it would be safe to discharge the patient home overnight before his VQ scan tomorrow.

Search outcome
Altogether 66 papers were found, one of which looked at outpatient treatment of patients with suspected PE. This is shown in table 10.

Comments
This is the only published study looking at outpatient treatment of PE and is small. Further research is needed.

> CLINICAL BOTTOM LINE
It may be safe to treat selected patients with suspected pulmonary embolus at home.

search, of which one presented the best evidence to answer the clinical question. The author, date and country of publication, patient group studied, study type, relevant outcomes, results and study weaknesses of this best paper are tabulated. A clinical bottom line is stated.

**Clinical scenario**
A 40 year old woman presents to the emergency department with pleuritic chest pain. She comments that she has had “cramp” in her left leg since discharge from the surgical ward after hysterectomy. Her ventilation-perfusion scan shows a high probability of pulmonary embolism. You have scored her as a high clinical probability of PE and therefore diagnose pulmonary embolic disease. She is comfortable, has normal oxygen saturations and is keen to return home to her family. You wonder whether treating her as a outpatient would be a safe option.

**Three part question**
Is it [safe] to treat a patient with [pulmonary embolic disease] as an [outpatient]?

**Search strategy**
Medline 1966–04/03 using the OVID interface. [(pulmonary embol$.mp OR exp Pulmonary Embolism OR PE.mp OR exp Thromboembolism OR pulmonary infarct$.mp) AND (treatment.mp OR exp Therapeutics OR LMWH.mp OR exp Heparin, Low-Molecular-Weight OR low molecular weight.mp OR exp Anticoagulants) AND (outpatient.mp OR exp Outpatients OR clinic.mp OR exp Outpatient clinics, hospital)] LIMIT to human AND English.

**Search outcome**
Altogether 282 papers were found, of which three were relevant (table 10).

**Comment(s)**
There are no large studies validating this approach to the treatment of pulmonary embolism.

**CLINICAL BOTTOM LINE**
It may be safe to treat a low risk group of patients with pulmonary embolic disease at home.

Accumulator BET: a traumatic pleuritic chest pain

Prepared by K Hogg, G Brown, K Mackway-Jones
