Jehovah’s Witnesses in the emergency department: what are their rights?

S Woolley

The Jehovah’s Witnesses Society is best known to outsiders for its refusal of blood products, even when such a refusal may result in death. Since the introduction of the blood ban in 1945, Jehovah’s Witness (JW) parents have fought for their rights to refuse blood on behalf of their children, based on religious beliefs and their right to raise children as they see fit. Adolescent JWs have also fought to protect their autonomy when making both contemporaneous and advance treatment refusal. The refusal of blood products by JWs raises ethical and legal dilemmas that are not easily answered. Do an individual’s rights (namely bodily control, right to privacy, right to decide about life/death issues, right to religious freedom) outweigh society’s rights (namely the preservation of life, the prevention of suicide, the protection of innocent third parties, and the maintenance of the ethical integrity of the medical profession)? Does the right to choose outweigh the value of human life? For doctors, conflict occurs between the desire to respect patient autonomy and the need to provide good medical care. The Watchtower Society (the JW governing body) imposes a strict code of moral standards among its members, and it is unlikely that individual JWs are making truly autonomous decisions about blood transfusions. While young children and adolescents are protected by the courts and conscious adults are afforded autonomy, dilemmas still arise in the emergency situation. This article examines the rights of young children, adolescents, and adults, focusing in the latter half on adults in the emergency situation.

YOUNG CHILDREN

Traditionally, when children are incompetent, the power to give or withhold consent to medical treatment on their behalf lies with those with parental responsibility. Legally, except in an emergency, parental consent is necessary to perform any medical procedure on an incompetent child. While courts throughout the western world recognise these parental rights, they are not absolute. The right to raise children is qualified by a duty to ensure their health, safety, and wellbeing. Parents cannot make decisions that may permanently harm or otherwise impair their healthy development.

“Parents may be free to become martyrs themselves. But it does not follow that they are free, in identical circumstances, to make martyrs of their children…”

The situation regarding the ability of mature minors to refuse medical treatment is not as straightforward. In Canada, despite pre-1996 court decisions supporting the notion of adolescent autonomy, adolescents may not refuse medical treatment. In the USA, three states recognise the "mature minor" concept but elsewhere adolescents rely on parental decision making. In England and Wales, mature minors may consent to, but may not necessarily be able to refuse, treatment. In Scotland, although not specifically referred to, the Age of Legal Capacity Act implies that a competent child may refuse, as well as accept, treatment.

ADOLESCENTS

The debate commenced in 1985 with Gillick v West Norfolk. The majority of the House of Lords were clear that if a child under 16 years could demonstrate sufficient understanding and intelligence to fully understand the treatment proposed they could give their consent to treatment. Unfortunately this case did not address the issue of treatment refusal. Subsequent cases may possibly be seen as undermining the ability of minors to make decisions about the refusal of medical treatment, as in each case the court has exercised its right to overrule the decisions of minors "in the best interests" of the child. In all cases concerning adolescent JW’s the courts have allowed transfusion, with the judges expressing concern about the child’s ability to make a fully informed decision.
decision because of their sheltered upbringing and the influence of the JW faith.

ADULTS

Although the state has an interest in the preservation of life, that interest is not absolute. Individuals have the right to control their own person and part of that autonomy is the “right to make choices pertaining to one’s health, including the right to refuse unwanted medical treatment.”22 Although this right should encompass all medical choices, including the refusal of blood products, JWs have had to defend this right in the courts.

Although there are no UK cases concerning competent non-pregnant adult JWs, cases have appeared before the courts in the USA since 1964.23 These cases focus primarily on an individual’s rights versus state interests. Earlier cases24 placed the state’s interest before an individual’s right to refuse unwanted medical treatment and subsequent cases have used a variety of arguments to transfuse adults against their wishes.25–28 However, in 1985 the appeal court in In Re Brown29 ended the debate with a strong statement supporting an individual’s right to refuse medical treatment:

“Rights are subject to compromise only when they collide with conflicting rights vested in others...The right of free exercise of religion protects more than mere beliefs...Religiously grounded actions or conduct are often beyond the authority of the state to control...”30

This statement is supported by subsequent cases,31 and gives competent adult JWs the right to refuse unwanted blood products, even in the USA.

THE EMERGENCY SITUATION

Unconscious JWs, with signed blood refusal cards, a form of advance directive, create medical, ethical, and legal dilemmas for healthcare professionals. English law is clear and unequivocal. Patients have the right to refuse medical treatment “for reasons which are rational or irrational or for no reason”12 and “even in circumstances where she is...certain to die in the absence of treatment”.32 This absolute principle is applicable to a competent patient’s anticipatory refusal of consent in the form of an “advance directive” or “living will”.12 Anticipatory refusals should ideally fulfill certain criteria,13 and there is concern that the blood refusal cards carried by JWs may not meet these criteria.

Since the 1970s, JWs have carried WTS distributed blood refusal cards. These cards specify that the owner will not accept blood products under any circumstances. Although theoretically, refusal is religiously motivated, the card recognises risks associated with blood,13 making it essential that treating physicians are satisfied that JWs have enough information regarding the risks and benefits of blood transfusion to make a decision to refuse it.

In an emergency, the doctor must be satisfied that a card carrying JW has been provided with the information necessary to make an informed decision. This is unlikely, as the WTS12 provides information about the risks but not the benefits of blood. In addition to the possible lack of information there is also concern about whether an individual’s decision to carry a card is without external influence (crucial when considering autonomy). The WTS decides which products JWs may accept, distributes the “boilerplate” cards annually, and initiates the card signing process. Disfellowshipping (a form of excommunication) is the penalty for accepting blood products, and thus it is unlikely that a decision to sign a blood refusal card is without external influence.

What, therefore, should doctors do in the emergency situation? In an emergency, treatment that is in the patient’s best interests may be given under the doctrine of necessity. However, this doctrine assumes that “under the circumstances, a reasonable person would consent, and thus the probabilities are that the patient would consent”.16 This doctrine is unlikely to apply to JWs, as most, if conscious, would object to treatment.16

Unfortunately, the two leading legal cases40 considering unconscious JWs offer conflicting advice. In Dorone,2 the Supreme Court upheld a decision to allow transfusion, whereas in Malette,3 the physician was found liable for battery. The standard in Dorone41 essentially precludes application of any form of advance directive. Conversely, the court in Malette41 accepted the undated, unwitnessed card at face value.44 The latter approach is not ideal; the decision was retrospective and it would be impossible to know whether the pre-printed wishes still reflected the patient’s views.

HE v a Hospital NHS Trust42 resolved these issues. A Muslim born woman who had converted to the JW faith following her parents’ divorce required life saving medical treatment for congenital heart disease. Shortly after her conversion, she signed a blood refusal card. Her father argued that this card should not be valid because: the girl was now engaged to a Muslim man and had consequently rejected her faith as a JW; she had not attended any JW meetings in the preceding 4 months, her advance directive predated her change in faith, and she had not mentioned the advance directive while conscious. The court accepted these arguments, adopting the approach in Dorone:41

“There are no formal requirements for a valid advance directive... There are no formal requirements for the revocation of an advanced directive... An advance directive is inherently revocable... The burden of proof is on those who seek to establish the existence and continuing validity and applicability of an advance directive... If there is doubt, that doubt falls to be resolved in favour of the preservation of life.”43

Therefore, in the emergency situation, if doubt exists about the validity of a blood refusal card, physicians should aim to preserve life and administer the necessary blood products.

CONCLUSION

JWs presenting to the ED continue to cause concern. However, the law regarding young children, adolescents, and adults (in the non-emergency situation) is clear: parents may not refuse blood on their children’s behalf if such a refusal is deemed unreasonable, adolescents cannot necessarily refuse blood, and competent adults can refuse unwanted treatment.

In an emergency, the situation is more complex, particularly as there are concerns about how informed individual JWs are about the risks/benefits of blood. Physicians should provide the necessary information for an individual to make an informed choice and where this is not possible, physicians should administer blood products in life threatening situations, if any doubt exists about the validity of a blood refusal card.

feeding the process of putting nutrition into one's system via the veins. Hence the attendant administering the transfusion is feeding the patient blood through the veins, and the patient receiving it is eating through his veins. *The Watchtower* 1951 July 415.
